Reflection Questions:

Q1. Did your estimations reflect the actual effort?

Ans: Mostly, yes. Stories like Browse Available Batches (3 points) felt genuinely quick and simple, while Reserve a Food Batch (8 points) was clearly the most complex — it had to check availability, handle the pickup window, and hand off into generating a code, so the higher estimate made sense.

Q2. Was your backlog well-prioritized?

Ans: For the most part. The four High-priority stories (Post Surplus Food, Browse Available Batches, reserve a Food Batch, Generate Verification Code) are exactly the ones that make the core donate-to-pickup flow work, so it made sense to put them in Sprint 1 first. The Medium and Low items — filtering, verification, notifications — are genuinely useful but the platform can technically function without them on day one, so pushing them to Sprint 2 felt like the right call.

Q3. How did your simulated sprint align with your plan?

Ans: Pretty closely. All four Sprint 1 stories moved from To-Do through In-Progress to Done without needing to pull anything back from Sprint 2, which suggests the 19-point estimate was a reasonable amount of work for one sprint. If anything had stalled in In Progress, that would've been a sign I'd overcommitted, but that didn't happen here.

Q4. What insights did the burndown chart give about your team's capacity?

Ans: The burndown line tracked the guideline fairly well rather than flatlining early or dropping off a cliff near the deadline, which tells me the work was reasonably well distributed across the sprint instead of being crammed in at the end.
